Innovative Quick Detach Two-Piece Adjustable Quiver

January 30, 2004 – Adding to its growing product line, Archery Research proudly unveils the new Adjustable Two-Piece Quiver that is sure to be an enormous success with bowhunters.

This new quiver features a molded hood that can be mounted in multiple locations allowing the archer to change the position and angle of the rack of arrows relative to the bow, as well as being able to accommodate different length arrows. The unique extended arrow clip holds five arrows at a slight angle, allowing them to be contained within the profile of the bow for protection. This quiver also has the ability to position the arrows as close to the riser as possible to improve the balance of the bow by optimizing its center of gravity. Another innovative feature is the adjustable rubber gripper on the machined aluminum clip that can use any diameter carbon or aluminum arrow. The AR quiver uses a unique reverse collet locking system making it the fastest two-piece detach quiver on the market today. This high quality quiver offers ultimate stability for years of rugged use.
